

Securing Networks with MikroTik Router OS

Zagreb, Croatia,
March 14th 2013

Presenter
Tom Smyth
CTO Wireless Connect Ltd.

Wireless Connect Ltd.

- ✓ Irish Company Incorporated in 2006
- ✓ Operate an ISP in the centre of Ireland.
- ✓ Good Infrastructure Expertise.
- ✓ Certified MikroTik Partners
- ✓ Training
- ✓ Certified OEM Integrators
- ✓ Consultants
- ✓ Value Added Reseller

Speaker Profile:

- ✓ Studied BEng. Mechanical & Electronic Engineering, DCU, Ireland
- ✓ Has been working in Industry since 2000
- ✓ Server Infrastructure Engineer
- ✓ Systems / Network Administrator
- ✓ Internet Security Consultant
- ✓ 1st MikroTik Certified Trainer in June 2007 in Ireland

Security Information sources

Router OS

- Highly Versatile
- Highly Customisable
- Highly Cost Effective
- Allows one to manage Security Threats in many Ways

What Can MikroTik Router OS Do ?

- It is a Stateful Firewall
- It is a Web Proxy
- It is a Socks Proxy
- It is a DNS Cache / Proxy
- It is a Router
- It is an IPSEC Concentrator
- It is an IDS – Intrusion Detection System
- It is an IPS – Intrusion Prevention System

Ways to Contact Tom

Previous MUM Presentations

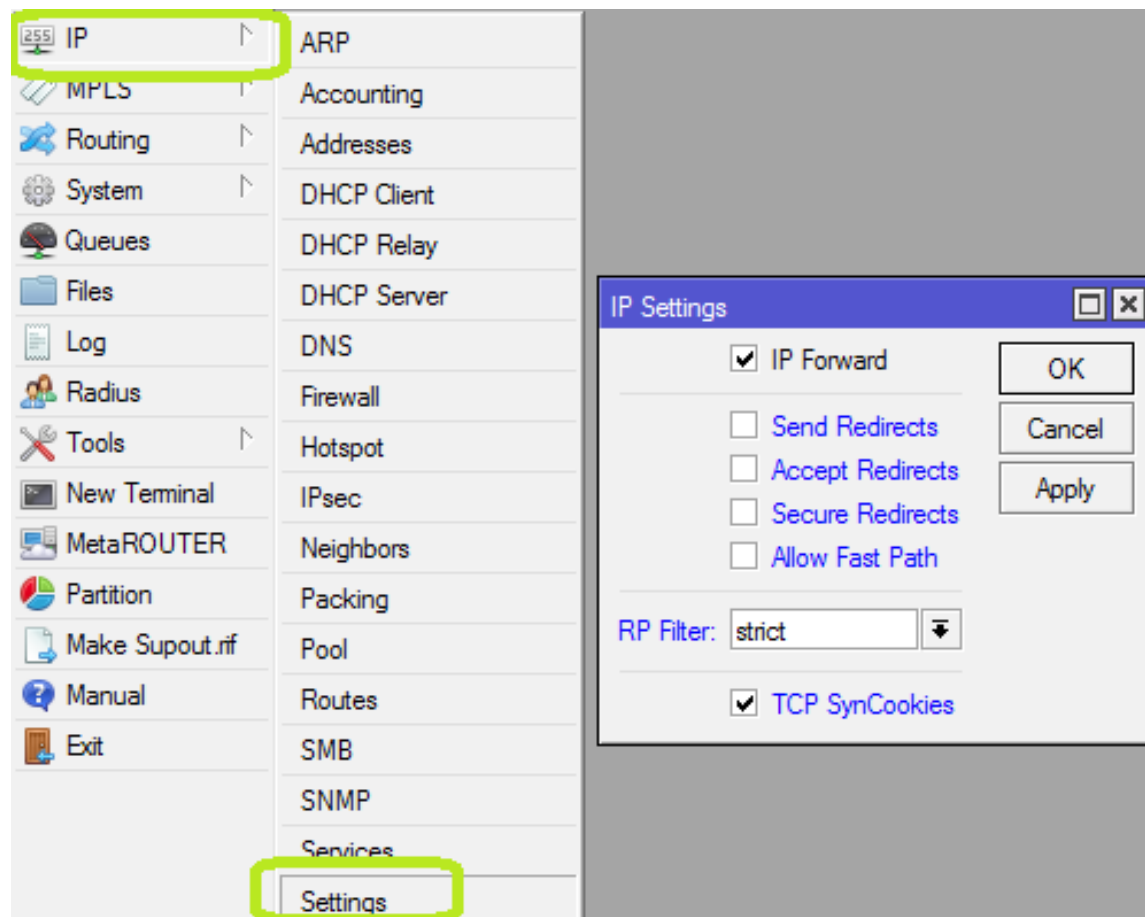

- See my presentations from previous mums for more information
 - MUM New Orleans 2012 -> MikroTik Advanced Security
 - MUM Dubai 2012 --> Blackhole Routing Techniques
 - MUM Budapest 2011 --> Advanced Firewall Strategies
 - MUM Poland 2010 --> Web Proxy as a Web application firewall
- Check out My good friend Maia Wardner of MD Brazil's Many Presentations on Network Security lots of examples and brilliant illustrations

Overview

- New IP Kernel hardening settings available in Mikrotik
- Implementing Port isolation in Bridges to achieve private vlan Functionality

IP Security Settings

- New Security Hardening settings are available in Mikrotik Router OS v6
- They set various fundamental Linux Kernel parameters to reduce security risks to your router and your networks
- The Settings Include:
 - IP Forward
 - Send Redirects
 - Accept Secure Redirects
 - Accept Redirects
 - Allow Fastpath
 - Reverse Path filtering
 - TCP Syn Cookie

IP Forward

- According to Industry best practice (NSA/ CIS) that systems that do not have router functionality should have IP forwarding disabled.
- Examples of Dedicated Systems that dont Require IP forwarding Capability
 - Usermanager
 - Proxy
 - NTP
 - DNS Servers
- Linux Kernel Parameter = `net.ipv4.ip forward = 0`
 - Disable the ability of the router to route packets from one interface to another based on IP

Why Disable IP Forward

- Prevents Servers / Appliances becoming unauthorised routers
- Prevents circumvention of firewall rules that block traffic based on incoming interface.

Send Redirects

- A Router can send redirects to request that a computer with a sub optimal routing table can be temporarily corrected to allow traffic to flow.
- Redirects are Expensive computationally for the Router and the Device Receiving them
- End Devices do not require Send Redirects
- Linux Kernel Parameters
 - `net.ipv4.conf.all.send_redirects = 0`
 - `net.ipv4.conf.default.send_redirects = 0`

Why Disable Send Redirects

- A Router could in advertently give an attacker information about the topology of the network
- “The Database Subnet” is reachable via 10.1.2.3, not me.

Accept Redirects

- Redirects inbound allow suboptimal routing tables on the router to be temporarily overridden to allow communications to occur
- They are computationally expensive redirected traffic increases load on the router dramatically

Why Disable Accept Redirects

- Accepting Redirects allows your Routing Table to be temporarily over ridden
 - Denial of Service
 - Vastly Increased Resource Usage
 - Potential for Redirecting Traffic through unauthorised devices (Man in the Middle)

Secure Redirects

- Accepting `secure_redirects` setting linux network interfaces to accept ICMP redirect messages only from default gateways in the routing table
- Kernel Parameters that control this setting
 - `net.ipv4.conf.default.secure_redirects = 0`
 - `net.ipv4.conf.all.secure_redirects = 0`

Why Disable Secure Redirects

- Accepting even secure redirects allows your Routing Table to be temporarily over ridden by ICMP traffic coming from Gateways in your routing table
 - Denial of Service
 - Vastly Increased Resource Usage
 - Potential for Redirecting Traffic through unauthorised devices (Man in the Middle)

Allow Fastpath

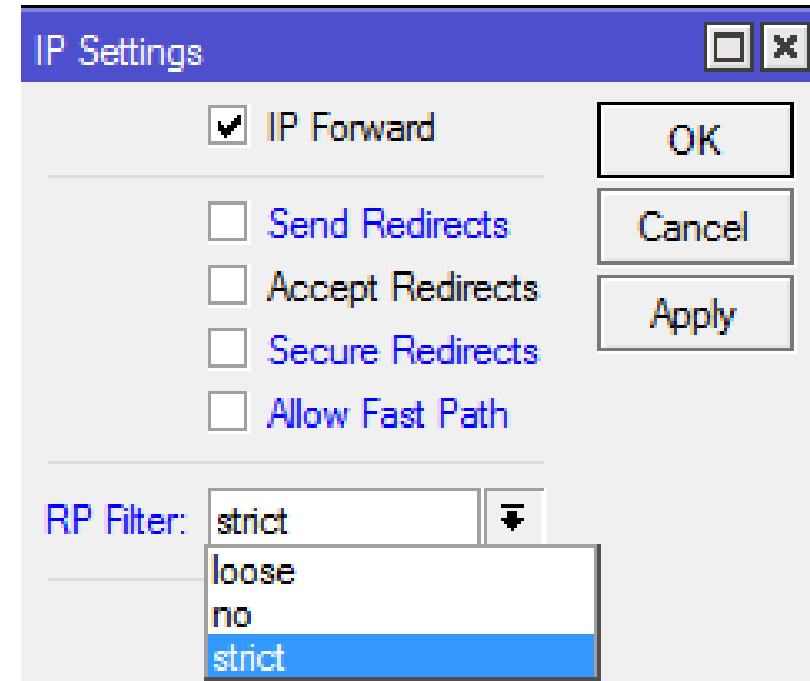

- Fastpath is a software optimisation of the kernel to allow significantly increased forwarding speed
- Fastpath optimises Throughput on a number of layers
 - Layer3 (Ipv4 and Ipv6)
 - Layer 2.5 (MPLS)
 - Layer 2 (Bridging)

Why not enable Fastpath?

- The Dramatic increase in throughput is achieved at the expense of firewall inspection and control
- If Traffic control and security is your priority, one may have to sacrifice some throughput.

Reverse Path Filter / Verification

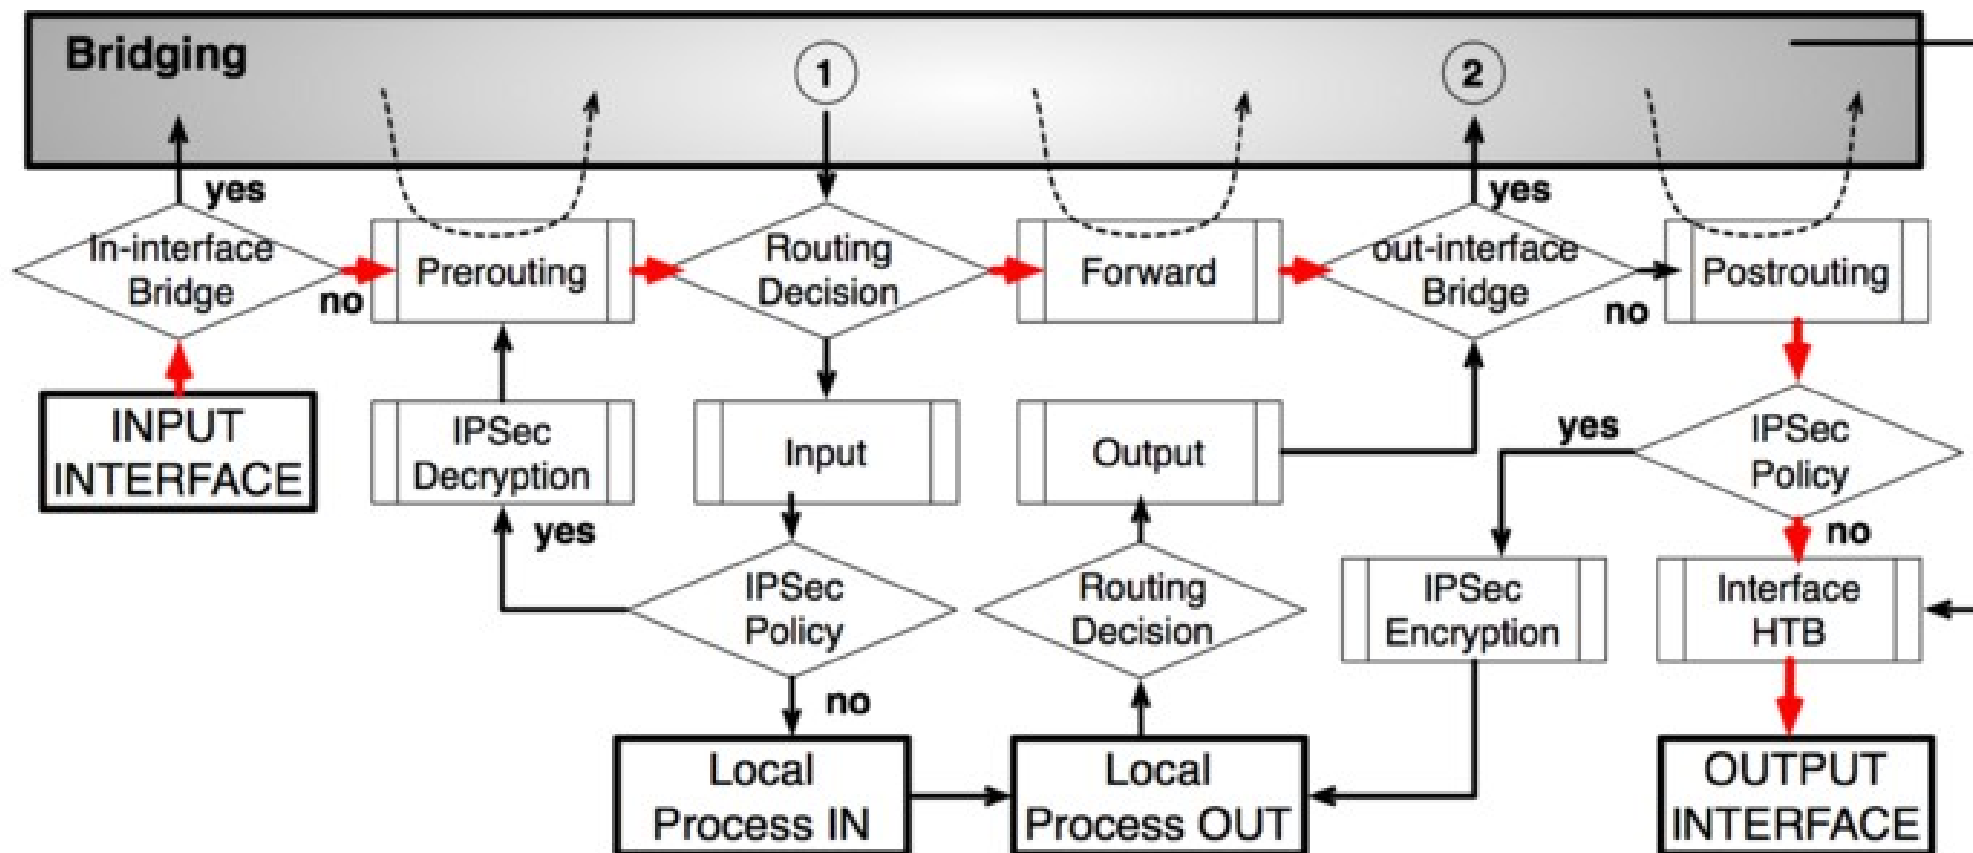

- Kernel level check of ingress traffic against IP Routing Table
- Strict RPF -> Only accept traffic entering on the interface that the Best / most specific route matching the packet uses
- Loose RPF -> Accept traffic entering on any interface that has a route that could be used to route to the IP
- Can be combined with Blackhole routes to allow bi-directional Enforcement of policy

Alternatives to Firewall Filtering

- If we want to filter traffic going towards a destination for example
- Let us take a look at the Kernel where, MikroTik Router OS Does its Magic

MikroTik Kernel -Packet Flow

- It Seems all packets flowing to / through the router are processed using the routing table

Filtering Using Routes

- Most people are familiar with Routing as a tool to help traffic reach its destination,
- These “Normal” routes are called Unicast routes

Route <0.0.0.0/0>

General Attributes

Dst. Address: 0.0.0.0/0

Gateway: 172.17.33.123 reachable ether1

Check Gateway:

Type: unicast

Distance: 1

Scope: 30

Target Scope: 10

Routing Mark:

Pref. Source:

enabled active static

Enter the BlackHole Route

- BlackHole – the name from the astronomical phenomena where any object placed into the BlackHole will never leave.
- BlackHole – Discard the Packet Route

The screenshot shows the 'New Route' configuration window in MikroTik WinBox. The window has a blue title bar and a white background. It is divided into two tabs: 'General' and 'Attributes'. The 'General' tab is active. The 'Dst. Address' field contains 'bad.ip.add.ess/Subnet_mask'. The 'Gateway' field contains 'loopback'. The 'Check Gateway' field is empty. The 'Type' dropdown menu is open, showing a list of options: 'blackhole' (selected), 'prohibit', 'unicast', and 'unreachable'. The 'Distance' field contains 'prohibit'. The 'Scope' field contains '50'. The 'Target Scope' field contains '10'. The 'Routing Mark' field is empty. The 'Pref. Source' field is empty. On the right side of the window, there are several buttons: 'OK', 'Cancel', 'Apply', 'Disable', 'Comment', 'Copy', and 'Remove'. At the bottom of the window, there are two checkboxes: 'enabled' and 'active'.

Why Enable Fastpath

- RPF + Black Hole Routes + Fastpath = Could mean Accelerated Filtering :)
- As long as RPF does not affect fastpath

TCP Syn Cookies

- Enabling Syn Cookies prevents the Age old Syn attack
Denial of Service Attack

IP v6 Kernel Parameters

The screenshot shows the WinBox interface with the terminal window open. The terminal displays the following output:

```

MMM MMMM MMM III KKK KKK RRRRRR OOOOOO TTT III KKK KKK
MMM MM MMM III KKKKK RRR RRR OOO OOO TTT III KKKKK
MMM MMM III KKK KKK RRRRRR OOO OOO TTT III KKK KKK
MMM MMM III KKK KKK RRR RRR OOOOOO TTT III KKK KKK

Bridge Horizon & Protected ports

Bridge Split Horizon

- Bridge Port Split Horizon is a feature that allows the efficient management of Traffic flow between ports
- Bridge Port Split Horizon was primarily developed as a loop avoidance Technology on VPLS meshed Layer 2 Networks
- Horizon values are only significant locally
- Horizons must be configured to avoid loops manually!
- Split Horizon allows or disallows communication according to the following rules
 - Frames are allowed flow between ports with different Horizon Values
 - Frames cannot Flow between ports with the same Horizon

Create the Bridge

The screenshot shows the MikroTik WinBox interface. The main window title is 'admin@D4:CA:6D:6F:63:43 (Bridge-Horizon-isolated-ports) - WinBox v6.0rc11 on RB2011UAS-2HnD (mipsbe)'. The left sidebar contains a menu with options: Quick Set, Interfaces, Wireless, Bridge, PPP, Switch, Mesh, IP, MPLS, Routing, System, Queues, Files, Log, Radius, Tools, New Terminal, MetaROUTER, Partition, Make Supout.rif, Manual, and Exit. The main area shows the 'Bridge' configuration page with tabs for Bridge, Ports, Filters, NAT, and Hosts. A table lists bridge configurations with columns: Name, Type, L2 MTU, Tx, Rx, Tx Pac..., and Rx. A 'New Interface' dialog box is open, showing the following fields:

- Name: bridge 1
- Type: Bridge
- MTU: 1500
- L2 MTU: (empty)
- MAC Address: (empty)
- ARP: enabled
- Admin. MAC Address: (empty)

Buttons on the right side of the dialog include OK, Cancel, Apply, Disable, Comment, Copy, Remove, and Torch. At the bottom of the dialog, the status is shown as 'enabled', 'running', and 'slave'.

Disable STP

The screenshot shows the MikroTik WinBox interface. The main window is titled 'admin@D4:CA:6D:6F:63:43 (Bridge-Horizon-isolated-ports) - WinBox v6.0rc11 on RB2011UAS-2HnD'. The left sidebar contains a menu with options: Quick Set, Interfaces, Wireless, Bridge, PPP, Switch, Mesh, IP, MPLS, Routing, System, Queues, Files, Log, Radius, Tools, New Terminal, MetaROUTER, Partition, Make Supout.rif, Manual, and Exit. The main area shows the 'Bridge' configuration page with tabs for Bridge, Ports, Filters, NAT, and Hosts. A 'New Interface' dialog box is open, showing the 'STP' tab. The 'Protocol Mode' is set to 'none', 'Priority' is 8000, 'Max Message Age' is 00:00:20, 'Forward Delay' is 00:00:15, 'Transmit Hold Count' is 6, and 'Ageing Time' is 00:05:00. The dialog box has buttons for OK, Cancel, Apply, Disable, Comment, Copy, Remove, and Torch. At the bottom of the dialog, the status is shown as 'enabled', 'running', and 'slave'.

Identify Ports physical and their Policy

- Clients cant talk to each other
- Clients can talk to servers
- Servers can talk to each other

admin@D4:CA:6D:6F:63:43 (Bridge-Horizon-isolated-ports) - WinBox v6.0rc11 on RB2011UAS-2HnD (mips)

Safe Mode

Set Port Horizon Value according to policy for servers

The screenshot shows the 'Bridge Port <sfp1-Client-Private>' configuration window in MikroTik WinBox. The 'General' tab is active, and the 'Status' sub-tab is selected. The configuration fields are as follows:

- Interface: ether1-Layer2-Uplink
- Bridge: bridge1
- Priority: 80 (hex)
- Path Cost: 10
- Horizon: 77- Unique value allows all ports access
- Edge: auto
- Point To Point: auto
- External FDB: auto

At the bottom of the window, there are two checkboxes: 'enabled' (checked) and 'inactive' (unchecked). On the right side of the window, there are buttons for 'OK', 'Cancel', 'Apply', 'Disable', 'Comment', 'Copy', and 'Remove'.

Set Bridge port Horizon value for Clients

The screenshot shows the 'Bridge Port <sfp1-Client-Private>' configuration window. It has two tabs: 'General' and 'Status'. The 'General' tab is active. The configuration fields are as follows:

- Interface: *sfp1-Client-Private*
- Bridge: bridge1
- Priority: 80 (hex)
- Path Cost: 10
- Horizon: 5 Ports with same value cannot talk to each other
- Edge: auto
- Point To Point: auto
- External FDB: auto

At the bottom of the window, there are two checkboxes: 'enabled' (checked) and 'inactive' (unchecked). On the right side of the window, there are several buttons: OK, Cancel, Apply, Disable, Comment, Copy, and Remove.

Configured Bridge / Switch with Pvlan Protection
